

## Module 02 - lecture 04b

**Food technologies  
to control the development of  
microbiological hazards**

# Technologies

## Technologies based on:

- **temperature control**
- **control of water activity**
- **control of pH**
- **control of redox potential**
- **antimicrobial agents**

# How temperature affects growth rate of a bacterial population

# Growth of *S. typhimurium* at different temperatures

# Temperature range for growth of pathogens

	<i>Temperature °C</i>		
	<i>Min.</i>	<i>Opt.</i>	<i>Max.</i>
<i>Salmonella</i>	5	35 - 37	47
<i>Campylobacter</i>	30	42	47
<i>E. coli</i>	10	37	48
<i>S. aureus</i>	6.5	37 - 40	48
<i>C. botulinum (proteolytic)</i>	10		50
<i>C. botulinum (non - proteolytic)</i>	3.3		25 - 37
<i>B. cereus</i>	4	30 - 35	48 - 50

# Temperature range for growth of toxigenic moulds

	<i>Temperature °C</i>		
	<i>Min.</i>	<i>Opt.</i>	<i>Max.</i>
<i>Penicillium verrucosum</i>	0	20	31
<i>Aspergillus ochraceus</i>	8	28	37
<i>Aspergillus flavus</i>	10	32	42
<i>Fusarium moniliforme</i>	3	25	37

# Temperature zones

Boiling point

Pasteurizing temperature

Body temperature

Fridge

Freezer

SAFETY

DANGER

SAFETY

# Psychrotrophic pathogens

- *L . monocytogenes*
- *Y . enterocolitica*
- *C . botulinum type*

# Water activity

- **Water is required for the growth and metabolism of microorganisms**
- **All the water in foods is not available for microorganisms**
- **The degree of availability of water is measured by water activity ( $a_w$ )**
- **Chemical and enzymatic reactions are also affected by availability of water**

# Water activity (definition)

$a_w$  is the ratio of water vapour pressure of food ( $p$ ) to that of pure water ( $p_o$ ) at the same temperature.

$$a_w = p / p_o$$

$$0 < a_w < 1$$

# Water activity

# Minimum levels of $a_w$ permitting growth ( at near optimum temperatures )

<b>Moulds</b>	<i>Aspergillus chevalieri</i>	0.71
	<i>Aspergillus ochraceus</i>	0.78
	<i>Aspergillus flavus</i>	0.80
	<i>Penicillium verrucosum</i>	0.79
	<i>Fusarium moniliforme</i>	0.87
<b>Yeasts</b>	<i>Saccharomyces rouxii</i>	0.62
	<i>Saccharomyces cerevisiae</i>	0.90
<b>Bacteria</b>	<i>Bacillus cereus</i>	0.92
	<i>Clostridium botulinum</i> (proteolytic)	0.93
	<i>Clostridium botulinum</i> (non-proteolytic)	0.97
	<i>Escherichia coli</i>	0.93
	<i>Salmonella</i>	0.95
	<i>Staphylococcus aureus</i>	0.83

# Range of $a_w$ in foods and their microbial flora

**$a_w$  range**

**Foods**

**Microbial flora**

**> 0.98**

Fresh meats  
 Fresh fish  
 Fresh fruits  
 Fresh vegetables  
 Canned vegetables  
 in brine  
 Canned fruit  
 in light syrup  
 (<3.5 % salt, 26% sugar)

(*C. perfringens*,  
*Salmonella*)

(*Pseudomonas*)

**0.93 - 0.98**

Fermented sausages  
 Processed cheese  
 Bread  
 Evaporated milk  
 Tomato paste  
 (10% salt, 50% sugar)

(*B. cereus*,  
*C. botulinum*,  
*Salmonella*)  
 lactobacilli,  
 bacilli and  
 micrococci

# Range of $a_w$ in foods and their microbial flora

## *$a_w$ range*

**0.85 - 0.93**

## *Foods*

Dry fermented sausages  
Raw ham (17% salt, saturated sucrose)

## *Microbial flora*

*S. aureus*  
Mycotoxin producing moulds  
Spoilage yeasts and moulds

**0.6 - 0.85**

Dried fruit  
Flour  
Cereals  
Salted fish  
Nuts

Xerophilic fungi

Halophiles  
Osmophilic yeasts

**< 0.6**

Confectionery  
Honey  
Noodles  
Dried egg, milk

No growth but may remain viable

# Water activity

*$a_w$  can be reduced by :*

- ◆ **Removing water (drying)**
- ◆ **Decreasing availability of water by crystallization (freezing)**
- ◆ **Decreasing availability by binding water with water binding agents e.g. salt, sugar**

# Concentration of NaCl and glucose at various $a_w$ values (at 25°C)

$a_w$	% w / w <i>NaCl</i>	% w / w <i>Glucose</i>
<b>1.00</b>	<b>0.00</b>	<b>0.00</b>
<b>0.99</b>	<b>1.74</b>	<b>8.90</b>
<b>0.98</b>	<b>3.43</b>	<b>15.74</b>
<b>0.96</b>	<b>6.57</b>	<b>28.51</b>
<b>0.94</b>	<b>9.38</b>	<b>37.83</b>
<b>0.92</b>	<b>11.90</b>	<b>43.72</b>
<b>0.90</b>	<b>14.18</b>	<b>48.54</b>
<b>0.88</b>	<b>16.28</b>	<b>53.05</b>
<b>0.86</b>	<b>18.18</b>	<b>58.45</b>

# Sorption isotherm (1)

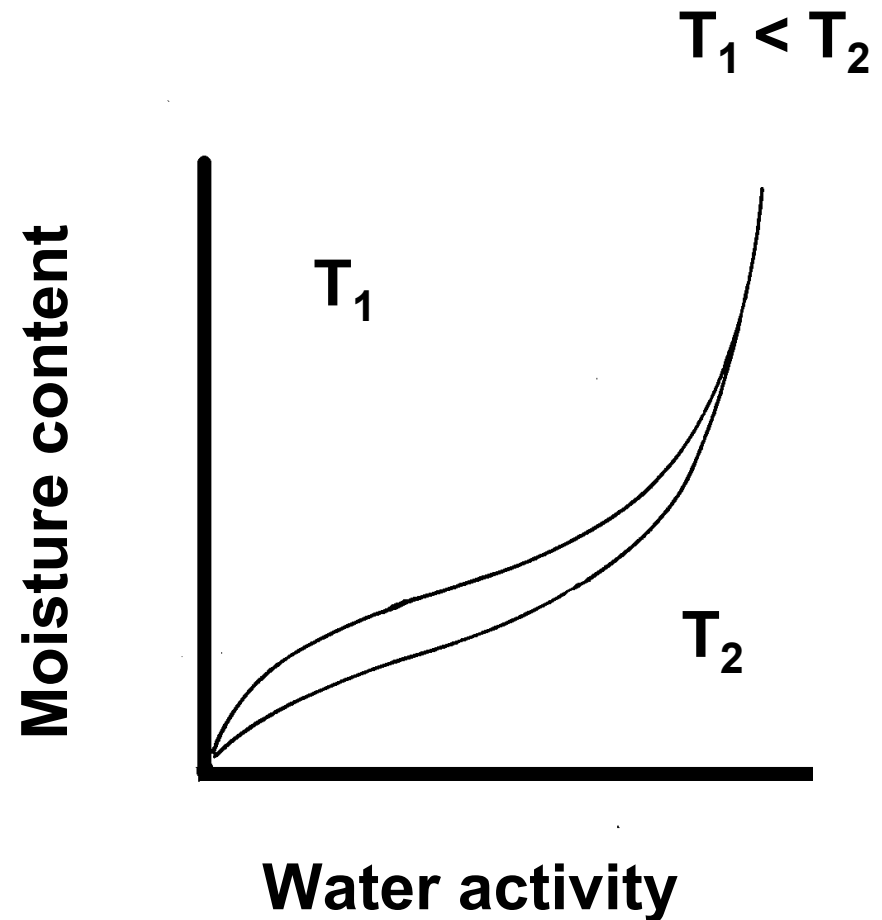

Sorption isotherm is a curve that demonstrates the relationship between water contents and  $a_w$

## Sorption isotherm (2)

The  $a_w$  and the sorption isotherm vary with temperature

This is of importance for the safety of low  $a_w$  foods which are packed in sealed packs or containers

# Drying methods

*Examples of drying methods are :*

- ◆ sun drying
- ◆ air drying
- ◆ spray drying
- ◆ freeze drying

# Drying rate (1)

*Drying rate depends on :*

- ◆ **air velocity**
- ◆ **surface area**
- ◆ **air temperature**
- ◆ **humidity of the air**

## Drying rate (2)

In air drying, the rate of drying can be calculated according to the following equation:

$$dw / dt = k_g \cdot a (P_{ws} - P_{wa})$$

$dw / dt$ : drying rate

$k_g$ : mass transfer coefficient

$a$ : surface area

$P_{ws}$ : water vapour pressure on the surface

$P_{wa}$ : water vapour pressure in the air

# Drying

Drying rate

*Moisture content*

Drying rate

*Moisture content*

Schematic presentation of drying curves

a. hygroscopic material

b. porous material

# pH values limiting the growth of pathogens

	<i>pH</i>	
	<i>Min.</i>	<i>Max.</i>
<i>Escherichia coli</i>	4.4	8.5
<i>Salmonella typhi</i>	4 - 4.5	8 - 9.6
<i>Bacillus cereus</i>	4.9	9.3
<i>Clostridium botulinum</i>	4.6	8.5
<i>Staphylococcus aureus</i>	4	9.8
<i>Saccharomyces cerevisiae</i>	2.3	8.6
<i>Aspergillus flavus</i>	2.0	11.2
<i>Fusarium moniliforme</i>	2.5	10.7
<i>Penicillium verrucosum</i>	2.0	10.0

# pH and other factors

**Microorganisms can grow in lab media at a wider range of pH than would occur in foods**

**Here, other factors come into effect e.g. microbial competition:**

- ◆ ***oxygen tension***
- ◆ ***storage temperature***
- ◆ ***reduced  $a_w$***
- ◆ ***heat damage to cells during processing***

## Acidification

- *addition of vinegar*

## Fermentation

- *organic acid*
- *competitive exclusion*
- *antimicrobial agents*

# pH of different foods

## *Approximate pH ranges of some common food commodities*

# Redox ( $E_h$ )

$E_h$  (mV)

low / negative: reducing medium

high / positive: oxidizing medium

$$E_h = E_o + RT / nF \cdot (\text{oxidant}) \cdot H^+ / (\text{reductant})$$

# Redox

*$E_h$  depends on :*

- ◆ availability of oxygen
- ◆ ratio of oxidant and reductant
- ◆ pH
- ◆ poisoning capacity
- ◆ microbial activity

# Redox and bacterial growth

**Obligate or strict aerobes:**

**positive  $E_h$**

**Obligate anaerobes:**

**negative or low  $E_h$**

# $E_h$ & pH values of foods

	<i>E (mV)</i>	<i>pH</i>
Raw meat	-200	5.7
Raw minced meat	+225	5.9
Cooked sausages and canned meats	-20 to -150	6.5
Wheat (whole grain)	-320 to -360	6
Barley (ground grain)	-225	7.0
Potato tuber	-150	6.0
Spinach	+74	6.2
Pear	+436	4.2

# Control of $E_h$

- Vacuum packaging
- Modified atmosphere packaging by gas flushing:  $\text{CO}_2$  ,  $\text{N}_2$

# Antimicrobial agents

- **Curing salts e.g. nitrites**
- **Bacteriocins e.g. nisin**
- **Gas: e.g. CO<sub>2</sub>**
- **Organic acids / salts e.g. benzoic, sorbic and propionic acid**

# Antimicrobial activity

*Depends on :*

- ◆ pH
- ◆ lipid
- ◆ microorganism

# Smoking

*Combination of several factors :*

- ◆ **heat treatment**
- ◆ **drying**
- ◆ **antimicrobial agent in the smoke**

# Combinations of food technologies

## *Combined technologies*

- ◆ **Milk pasteurization and aseptic packaging**
- ◆ **Hurdle technologies**
  - **fermentation, smoking**
  - **Refrigerated processed food of extended durability (REPFED)**
